1) Ortho (Osteoarthritis)

Nature of study & Study Directors	Institution where study was conducted & publication(s) (where applicable)	Year started	Year ended	Number of patients	Success Rate (%)	Definition of success used in study [% showing improvement]	Notes
<p>An early "Comprehensive Report of all patients treated with Magnetic Therapy at Waterbury, from January 1990, for chronic and/or persistent, joint-disorders", was compiled, outlining the outcomes of the Pilot, Double-Blind and Open Trial, Studies, being conducted. A tabulated précis of the initial data obtained, is provided</p>	<p>Yale University School of Medicine Teaching Hospital, Waterbury, Connecticut</p> <p>Yale Clinical Presentations</p>	1990	1991	<p>Total=142 patients²</p> <ul style="list-style-type: none"> 13 in a Pilot Study {observational } 50 in a Placebo-Controlled Double-Blind (DB) Phase I Study 52 in a Placebo-Controlled Double-Blind (DB) phase II 	<ul style="list-style-type: none"> Open Pilot Study: 77% definite improvement Placebo-Controlled DB Phase I: 87% definite improvement 25% improvement in the placebo. Placebo-Controlled DB Phase II: 75% definite improvement 37% 	<p>Assessments were made using the Overall Response Ratings, based on a Final Evaluation Key (developed in conjunction with St. Mary's physicians). Assessments were made following individual patient evaluation:</p> <ul style="list-style-type: none"> Definite = Maximal therapeutic response considering stage of disease process) Improved = Good (short of maximal therapeutic response) Slight = Fair; minimal response None = Absence of therapeutic response 	<p>All 142 patients received at least five evaluations:</p> <ul style="list-style-type: none"> Baseline 2-week follow-up 4-week follow-up Final 2-week post-treatment evaluation. <p>In general, good to very good results were obtained in all studies, with high statistical significance.</p> <p>[More specifically, in the Placebo-</p>

² From January 8 to June 12, 1990, a total of 142 patients were given magnetic therapy treatment. Initially, an observational study of 13 patients with chronic and/or persistent disease was conducted. Further, a total of 102 patients were entered into a randomized, Double-Blind placebo controlled study. This study was conducted in two phases: the first being a 50 patient-joint study, and the second, a 52 patient-joint study. Additionally, a total of 27 patients were entered into an open crossover study of non-responding patients from the double-blind controlled study. The magnetic therapy center moved, and this study continued until March 1991.

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

DB-1 to DB-4 below are all Prospective, Randomized Double-Blind Placebo-Controlled Studies Using Extremely Low Frequency Electromagnetic Induction Therapy in the Treatment of Patients with Inflammatory and Non-Inflammatory Arthritis.

<p>2. DB-1 (Initial Pilot) A Double-Blind trial of the clinical effects of Pulsed Electromagnetic Fields in Osteoarthritis.</p> <p>T.P. Greco, Richard Markoll</p>	<p>Yale University School of Medicine Teaching Hospital Waterbury, Connecticut</p> <p><i>Journal of Rheumatology</i> 1993; 20(3): 456-460.</p>	1990	1991	47	Approx. 70%	<p>The difference in means between the treated and placebo groups were evaluated by two-tailed t-tests. The baseline data were analyzed for frequency distribution to ensure an approximately normal distribution.</p>	<p>Good to very good results, with high statistical significance</p>
<p>3. DB-2 (2nd Pilot) A Double-Blind Trial of the Clinical effects of Pulsed Electromagnetic Fields in Osteoarthritis.</p> <p>D.H. Trock, A.J. Bollet</p>	<p>Yale University School of Medicine Teaching Hospital Waterbury, Connecticut</p> <p><i>Journal of Rheumatology</i> 1993; 20(3): 456-460.</p>	1990	1991	42 (27 with osteoarthritis)	Approx. 70%	<p>VAS (Visual Analog Scale) and ADL (Activities of Daily Living) were used at different time periods, before and after treatment. An average improvement of 23-61%, in clinical variables, was observed in the group receiving active treatment, while only 2-18% was observed in the placebo group.</p>	<p>Good to very good results, with high statistical significance</p>

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

<p>4. DB-3 The effect of Pulsed Electromagnetic Fields in the treatment of Osteoarthritis of the Knee. D.H. Trock, R. Roseff, M. Spiegel, E. Heller, R.M. Higley, R.H. Dyer, Jr., W.K. Miner, S.H. DeWitt</p>	<p>Three Trial Centers under a protocol from Yale University School of Medicine Teaching Hospital Waterbury, Connecticut.</p> <p>The effect of Pulsed Electromagnetic Fields in the treatment of Osteoarthritis of the Knee and Cervical Spine. Report of Randomized, Double-Blind, Placebo-Controlled Trials. <i>Journal of Rheumatology</i> 1994; 21:1903-1911.</p>	1991	1992	86	Approx. 70%	<p>The difference in means between the treated and placebo groups were evaluated by two-tailed t-tests. The baseline data were analyzed for frequency distribution to determine an approximately normal distribution. The difference in means was greater at the end of treatment, rather than at the midway observation, primarily because of a much greater improvement in the treated group at the end.</p>	<p>Good to very good results, with high statistical significance for pain, pain on motion; and for both the patient's, and physician's, global assessment.</p>
<p>5. DB-4 The effect of Pulsed Electromagnetic Fields in the treatment of Osteoarthritis of the Cervical Spine. D.H. Trock, R. Roseff, M. Spiegel, E. Heller, R.M. Higley, R.H. Dyer, Jr., W.K. Miner, S.H. DeWitt</p>		1991	1993	81	Approx. 70%		

2) Ortho (Arthritis and Osteoarthritis)

Nature of study & Study Directors	Institution where study was conducted & publication(s) (where applicable)	Year started	Year ended	Number of patients	Success Rate (%)	Definition of success used in study [% showing improvement]	Notes
<p>6. Open Initial Trial A Prospective Study Using Extremely Low Frequency Electromagnetic Induction Therapy in the Treatment of Patients with Inflammatory and Non-Inflammatory Arthritis.</p> <p>T.P. Greco, R. Markoll</p>	Yale University School of Medicine Teaching Hospital Waterbury, Connecticut	1990	1991	69	Approx. 70%	The difference in means of the treated and placebo groups were evaluated by two-tailed t-tests. The baseline data were analyzed for frequency distribution to ensure an approximately normal distribution.	Good to very good results, with high statistical significance
<p>7. Open Trial 1 A Prospective Study Using Extremely Low Frequency Electromagnetic Induction Therapy in the Treatment of Patients with Inflammatory and Non-Inflammatory</p>	Yale University School of Medicine Teaching Hospital Waterbury, Connecticut	1990	1991	97	Approx. 70%		Good to very good results, with high statistical significance

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

<p>Arthritis</p> <p>R.H. Dryer, Jr. W.K. Miner, S.H. De Witt</p>						<p>The data generated from these open studies suggest that this type of therapy may be effective for different joints affected by osteoarthritis, as well as other types of arthritis, and/or other joint-related conditions.</p>	
--	--	--	--	--	--	---	--

<p>8. Open Trial 2 A Prospective Study Using Extremely Low Frequency Electromagnetic Induction Therapy in the Treatment of Patients with Inflammatory and Non-Inflammatory Arthritis</p> <p>D.H. C.3) Tinnitus

Nature of study & Study Directors	Year started	Year ended	Number of patients	Measurements and success	Conclusive Findings
<p>22. Morbus Tinnitus (A Pilot Study) K. Pfeiffer <i>et al</i></p>	<p>1999 (April)</p>	<p>2000 (Feb.)</p>	<p>43</p>	<ul style="list-style-type: none"> VAS (Visual Analog Scale) was used to assess the degree of their Tinnitus. Patients were evaluated before PST™-treatment, after the 12-day PST™-treatment period, 6 weeks thereafter, 12 weeks, and 6 months. Final evaluation at 12 weeks: 52% were significantly improved and 22% were symptom free. 	<p>Following analysis, Goebel-Hiller Scores showed a definite and significant improvement in 52% of the patients, evaluated. This improvement was found to increase over time (long-term effect).</p>

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

<p>23. Chronischer Mobus Tinnitus (A Pilot Study) K. Pfeiffer, R. Markoll, R. Breul</p>	1999	2001	78	<p>The severity of Tinnitus was assessed using Goebel-Hiller Scores. Patients were evaluated before PST™-treatment, after the 12-day PST™-treatment period, 6 weeks thereafter, 3 months, and 6 months.</p>	<p>A definite improvement was found 3 months post-PST™ treatment. This improvement was found to increase over time (long-term effect).</p>
<p>24. Three Prospective Clinical Trials conducted in Berlin, Nuremberg and Munich, Germany, on Chronic Tinnitus (Grades, II, III, or IV). M. Dornacher, G. Buschmann, K. Pfeiffer <i>et al.</i></p>	1997	2000	<p>Tot. = 199 patients [128 females and 71 males ranging in age from 17 to 78 years (mean age 57)].</p>	<p>Treatment consisted of 12 one-hour PST™ sessions conducted over a two-week period. All patients were evaluated before and at the end of treatment, and six and 12 weeks after the treatment using validated measurement instruments (Goebel-Hiller). Data on hearing loss and other relevant parameters were also obtained.</p>	<p>Randomly selected patients, with long-standing Tinnitus, who failed to respond to conventional treatments, were and the population at large, chosen as the control. A gratifying and progressive trend of improvement was reported at the end of treatment and six weeks later (an additional 25% of the patients). Final evaluation 12 weeks following treatment revealed that 26% were unchanged, 52% were very significantly improved, and 22% were now completely symptom free. No adverse side effects were reported or noted. Many in the significantly improved cohort reported a loss or diminution of high frequency pitch ringing or replacement by a low frequency hum that was much less disturbing.</p>

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

<p>25. Tinnitus Randomized Multi-Center Double-Blind Clinical Study</p> <p>Biesinger, Guth, K. Pfeiffer <i>et al.</i> Nyhuis, Gabler, Dornacher, Sikezsdy, Hilber</p> <p>(Conducted at a Clinics and Medical Centres)</p>	1999	2002		<p>Patients were examined and the impairment due to Tinnitus assessed and measured using the tinnitus questionnaire of Goebel-Hiller (1998). The intensity/severity of the Tinnitus was graded (classified) as low, medium, high or very high, depending on the total score obtained on the Goebel-Hiller questionnaire, for all psychometric measurements made.</p> <p>The data was statistically analyzed using the paired-samples T-test, pre-treatment, after the 12-day treatment period, and thereafter, at 6 weeks, 3 months, 6 months, and 1-year.</p>	<p>It was found that following the 12-day treatment, as well as, at 6 weeks and 3 months thereafter, there was a statistically significant difference ($p > 0.05$) between the degree (grade) of tinnitus severity, compared to pre-treatment. This indicates that, with time, treatment decreases the overall severity of the tinnitus to a statistically significant degree.</p>

Nature of study & Study Directors	Location	Year Started	Conclusive Findings
<p>Studie zum Nachweis der Wirksamkeit der PST bei Patienten mit gesicherter Osteoporose (Pilot Study)</p> <p>K. Pfeiffer* H. Radspieler** R. Markoll*</p>	<p>* Infinomed – Institut für Innovative Medizin, München</p> <p>** Osteoporose Diagnostik- und Therapiezentrum München</p>	2002	<p>In the control group (the wrist not subjected to PST™), no significant changes in vBMD were observed. However, at the end of treatment, an increase in trabecular vBMD was observed in the wrist subjected to PST™, which continued increasing at 3- and 6-months post end of treatment. This increasing trend suggests a balancing (restoration) of the resorption and formation processes, characteristic of bone remodeling, by PST™.</p> <p>PST™ demonstrates positive effects on bone formation and restores the innate balance of the remodeling process(es). In the long-term, it is postulated that PST™ will continue to stimulate bone formation, and retard bone resorption, until the innate balance between bone formation and bone resorption has been restored.</p>

Completed *in vitro* Studies

Nature of the Study	Institution where the study was conducted & publication(s) (where applicable)	Published in	Notes
<p>26. The stimulation of chondrocyte metabolism by pulsed magnetic fields</p> <p>D-A Grande, A.J. Bollet, R. Markoll</p>	<p>North Shore University Hospital, New York (affiliated with Cornell University), USA</p>	<p><i>Draft</i>, 1992.</p>	<p>The purpose of this study was to examine the potential biostimulation of the BMTS field configuration on <i>in vitro</i> cartilage explants maintained in organ culture during exposure to the electromagnetic (EM) fields. During exposure to the EM fields, a strong effect was seen in response to sulfate incorporation that was statistically significant at the 0.05 level. This is perhaps the most significant parameter for assessment of repair or relief, as proteoglycan is one of the principle matrix molecules lost in OA.</p>
<p>27. Pulsed Signal Therapy (PST) enhances the proteoglycans concentration in human chondrocyte cultures.</p> <p>F. Nerucci, A Fioravanti C.Tofi, K. Righeschi, R. Marcolongo, R. Markoll</p>	<p>Institute of Rheumatology, University of Siena, Siena, Italy</p>	<ul style="list-style-type: none"> • <i>Bioelectromagnetics Society [BEMS] Twenty-Second Annual Meeting Abstract Book</i>, Munich, Germany, June 11-16, 2000: 48. • Fioravanti A, Nerucci F, Collodel G, Markoll R, Marcolongo R. Biochemical and Morphological Study of Human Articular Chondrocytes cultivated in the presence of Pulsed Signal Therapy. <i>Ann</i> 	<p>This study focused on the biochemical and morphological analysis of human articular chondrocytes cultured in the presence and absence of Interleukin-β (II-β) and subjected to PST[™]. The presence of large vacuoles in the cytoplasm, devoid of other cellular structures, confirmed the marked cellular damage, caused by II-β. Stimulation of these cells by PST[™] was found to restore cell structures, and so too, proteoglycan synthesis by chondrocytes. A significant ($p < 0.05$) increase in PG concentration in the culture medium of cells subjected to PST[™] exposures was found, exceeding that in the control groups. No significant additional differences were found for those cell cultures subjected to pressure cycles.</p> <p>The increase in metabolic activity was further supported by morphologic assessments carried out with a transmission electron microscope (TEM) and a scanning electron microscope (SEM). These results collaborate with studies showing electric stimuli and PEMF enhanced cartilage repair, increased [³H] Thymidine incorporation into chondrocyte DNA of chondrocytes (proliferation), as well as ³⁵SO₄ uptake (glycosaminoglycan production). They provide evidence in</p>

PST – PROVEN, DOCUMENTED & CURRENT STUDIES

		<i>Rheum Dis.</i> 2002; 61:1032-1033	general support of the explanatory hypothesis, in particular, confirming the argument that PST™ exposures tend to enhance proteoglycan concentrations in challenged human cartilage tissues.
<p>28. Pulsed Signal Therapy (PST) Stimulates Mitosis of Human Chondrocytes in Culture.</p> <p>H. Gierse, R. Breul, M. Faensen, R. Markoll</p>	Praxis für Orthopädie und Sporttraumatologie, Cologne, Germany	Singapore Humanitas Press, <i>In Proceedings: Tenth International Conference on Biomedical Engineering.</i> Singapore, December 2000; 473-474.	This experiment clearly demonstrated that human chondrocyte cell cultures exposed to the specific electromagnetic fields generated by PST™ attained statistically significant higher mitosis-rates than chondrocytes in untreated cultures. This <i>in vitro</i> finding confirms the positive results of over twenty prospective clinical studies of patients suffering from osteoarthritis and supports one of the proposed mechanisms of action that may be responsible for these benefits.
<p>29. Der Einfluss der Pulsierende Signale Therapie auf die Synthese der Extracellulären Matrix in 3-Dimension Human Chondrozyten [The PST Effect on 3-Dimensional Chondrocyte Culture: An In Vitro Study].</p> <p>I. Krüger, T. Knedel, J. Zimmermann, M. Sittinger, M. Faensen</p>	University Center, Charité, Humboldt University, Berlin, Germany	<ul style="list-style-type: none"> • Presentation at the Deutsches PST Symposium [PST Symposium] - Salzburg, Austria; May 19, 2001. <p>Presentation at the 1st Biennial Meeting of the Tissue Engineering Society ETES -2001 Symposium of the International Cartilage Repair Society (ICRS) - Freiburg, Germany; Nov. 7-10, 2001.</p>	Histological analysis revealed the formation of cartilaginous extracellular matrix in PST™-treated cultures and controls. On the basis of biochemical analysis, treatment of meniscal and arthritic chondrocyte cultures resulted in an increased deposition of collagenous matrix components. For arthritic, articular chondrocytes, only a marginal enhancement of collagen synthesis was documented almost directly after stimulation of artificial cartilage cultures. For meniscal chondrocytes, PST™ demonstrated a positive effect on matrix formation in the long-term (up to 6 months post-electro-magnetic stimulation).
<p>30. Study of the clinical effect of PST with trials of the Synovial liquid in</p>	Auguste-Victoria-Hospital Berlin, University of Erlangen	Commenced: 1998 Terminated: 2001	In general, matrix metalloproteinases (MMP's) are responsible for the degradative (CATABOLIC) events invoked in the cartilage and bone of arthritic joints. However, some have a dual function, and are

<p>gonarthrosis.</p> <p>D. Schuppan, M. Faensen R. Markoll</p>		<p>Submitted for publication</p>	<p>therefore also responsible for triggering events and signalling pathways, to restore and rebuild damaged tissue (ANABOLIC).</p> <p>Two-tailed t-tests for difference between means, showed statistically significant difference between pre- and post-PST™ treatment*, for MMP 1 and 9. The increased levels of MMP1 and MMP9 obtained, suggest that PST™ may function to ensure rapid onset of restoration of damaged tissue. In addition, the pain intensity, two-tailed t-tests for difference between means, showed statistically significant difference between pre- and post- PST™ treatment*. Pain decreased significantly with time, post-PST™ treatment*.</p> <p>Increased levels of bifunctional MMP's, 1 and 9 were obtained, post-PST™ treatment*, suggesting that PST™ may function to stimulate these, triggering the onset of catabolic events, and in so doing, shortening the time span to initiate anabolism (p<0.05). Pain intensity evaluated pre- and post-PST™ treatment*, with regards to morning awakening, at rest (night), on ascending and descending stairs, on standing for 15 minutes, and also on descending stairs, shown significantly increased decreases, in all regards, post-PST™ treatment* (p<0.05).</p> <p>Pearson Correlation showed that the clinical results and improvement in pain (assessed by VAS and ADL) obtained, correlated with the change in levels of ECM parameters measured in the joint fluid post-PST™ treatment* associated with ECM breakdown and repair.</p>
